1. Introduction

1.1. Title

Device Bound

1.2. Abstract

The game is based on the idea of having the player experience a learning curve with the main component, the experimental devices. Specifically, there will be 4 different devices that will be unlocked throughout the game as progress is made. Eventually having to use all of the devices efficiently.

1.3. Lore

The main character was a scientist of the company UWDF (Underground weapon development facility), who after an EMP (electromagnetic pulse) attack by a terrorist group fell unconscious. The player wakes up at the lowest level and has to escape the now abandoned facility, which only has the highly unstable experimental devices left and learn what happened through some information left behind by the other workers.

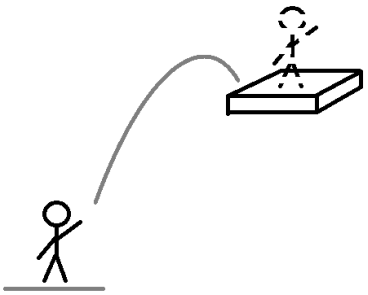

2. Gameplay

2.1. Mechanics overview:

The game has a main mechanic that is focused on these experimental devices, which are some tennis ball sized spheres with different functionalities. Their names are UED (unstable experimental device) followed by a number.

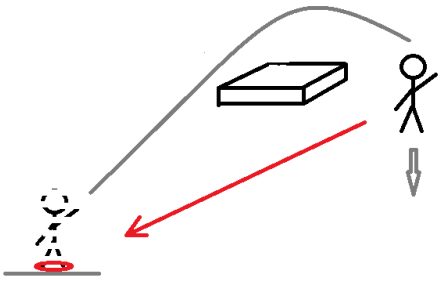

2.1.1. UED - 088 (Teleportation Device)

This device is the one we will use as a sphere that the player will be able to throw a certain distance (visible by the player as the direction where the ball will go can be seen before throwing it) and teleport to wherever it falls. We will take into consideration the fact that walls will not count as a surface that will trigger the teleportation only floors.

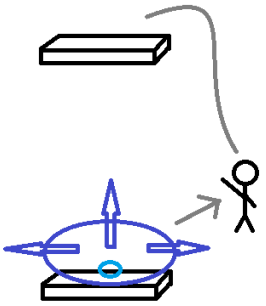

2.1.2. UED - 313 (Return Device)

This is a complementary device to the teleportation one since they are meant to be used in a complementary manner. This device will be placed where the player is standing and will have a timer set to it, where if still in available time the player will be able to press a button and return to the place where the device was placed. This is especially useful in the scenario where the teleportation device is missed and it lands in an unwanted place the player can go back a few steps.

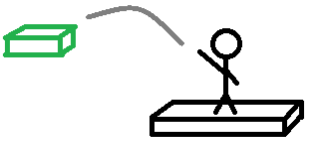

2.1.3. UED - 115 (Shockwave Device)

This device is used to launch the player into the air. This device will be unlocked at the middle stage of the game once the player knows how to use the teleportation device to make the game more challenging now. The player will have to use the shockwave device and once in the air use the teleportation device.

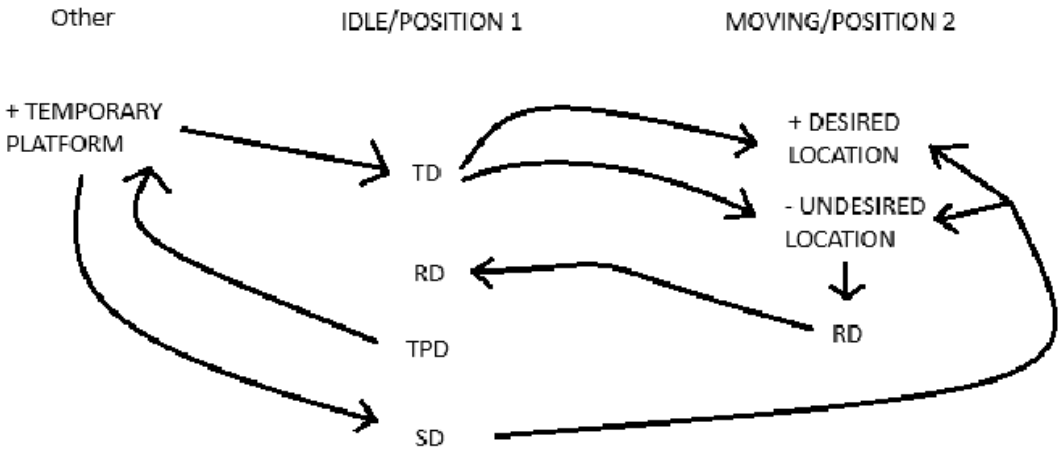

2.1.4. UED - 949 (Platforming Device)

The last and final device will be used at the end of the game which will be some device that will be only able to throw a short distance but will create a temporary platform for the player for a short amount of time.

2.2. Core Loop:

The Core Loop consists in the player being in one position with many different choices TD being teleportation device, RD being return device TPD being temporary platform device and SD shockwave device. The player can use TD or SD to move to either the desired location or miss and go to an undesired location and then have to use the RD to return and try again. We also have the temporary platform from which we can then either use TD or SD.

2.3. Win/Lose conditions

- The player can consider a victory once it reaches the end of the game having reached the top of the map.
- There is no real Lose condition, it is mostly frustrating since you have to start over from the checkpoint.

3. 3 C's

1. Character

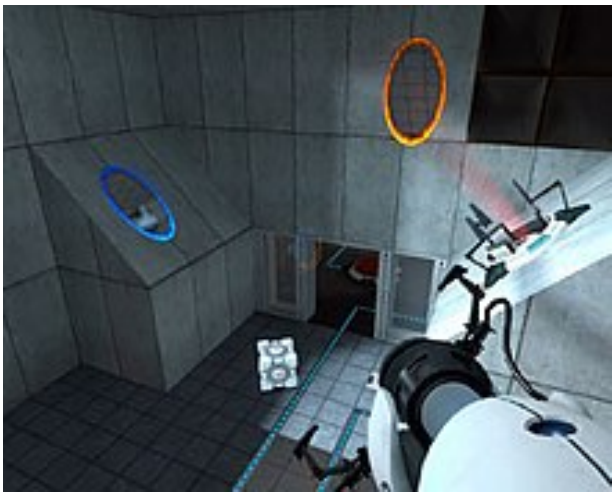

The character does not have that much complexity since it is just an ordinary scientist that has to escape the facility. Moreover, since the game will be in first person no need to spend a lot of time on a complex character.

2. Camera
   The camera will be first person in order to make the game more fluent and more precise when using the devices since in games that require precision, first person is mandatory.

3. Control
   The controls for this game will be, firstly, the mouse or joysticks for the camera. Secondly, WASD format for keyboard and again joysticks for controller. For the keyboard in order to choose which device we will use the 1, 2, 3 and 4 keys. For the controller we will use the gamepad arrows. Lastly, space and the cross to jump in keyboard and controller respectively.

4. Visual style references
   The visual references would be a style similar to the game Portal.

5. Similar game references
   Similar game would be Portal but with a different main mechanic and the fact that the idea is to go upwards and different lore.
